

HD 1080P WiFi iPhone Docking Station

Model No: WF-DH-01

Price: \$235.00

Short Description

Can you believe this!! Hidden Camera Surveillance has the latest release Iphone or Android fully functional Docking Station Mobile Phone charger Spy Camera but with built in WiFi. That's right, you can use this device as a mobile phone charger and at the same time remotely LIVE accesses the covert 1080P HD camera from basically anywhere in the world.

Download the free App to your phone then login at any time to view whatever the camera can see LIVE, listen into conversations surrounding the docking charger and even be email alerted when the moment the camera detects motion.

Description

So how does it all work? Everyone has a mobile phone nowadays so the introduction of a phone charger wouldn't raise any suspicion whatsoever, even your spouse. Who on earth would ever suspect that a functional mobile phone charger conceals a HD pinhole camera, a micro SD card for HD motion recording (or constant recording) plus a miniature WiFi module?

Many of our customers feel that introducing a foreign object or new device into the house or office etc is likely to attract suspicion and for that reason feel uneasy about ordering a hidden camera. Yes in certain circumstances that can happen but certainly not something like this.

If you feel your spouse/partner or business colleague would be suspicious of a phone charger, then I'm sorry to say you might be just a tad paranoid. In terms of super high quality motion activated recording devices with or without WiFi, I can say I have never seen anything like this before. From a personal point of view and dealing in all sorts of covert devices, this seriously takes the cake.

Our new black fully functional Android or Iphone docking station is supplied with a 5V USB power supply, which powers the docking station so yes you can charge your phone as well. The docking station very cleverly conceals a super high-resolution 1080P HD pinhole camera, a pinhole size microphone, a concealed micro SD card slot and an internal WiFi module. This is NOT a battery operated device it's 5V powered.

The lens is a very wide-angle 100 degrees so it can basically see all of any size room with clarity. Connect the Docking station to power and allow a few minutes for it to silently boot. There are no telling lights or noises to be concerned about.

Assuming you have WiFi available at the camera location, switch your mobile phone to WiFi and after a short time you will see series of numbers and letters appear. To anyone else using the same WiFi network, seeing a series of numbers and letters will mean nothing, it could be someone next door. In any event there is NO reference to anything hidden and no reference to a camera. You cannot simply click on the numbers to see the camera. You must have the App and you must have your user name and password, which can be changed at any time. In other words don't be concerned about someone being suspicious; they would not have a clue.

As the authorized user and once you have downloaded the free App from the app store, follow instructions to see the camera live, even listen to the camera surroundings. You can do this direct from your mobile phone or PC. Only authorized users may remotely login to the camera LIVE from anywhere in the world either from another WiFi location or using your mobile phone 3/4G service.

This remarkable WiFi Camera is NOT battery operated so it must be connected to power. View the camera live via 3/4G or any other WiFi hot spot basically anywhere in the world. Open the App menu on your mobile phone and select motion detection email alerts with picture attached On/Off. When armed receive an alert and whilst the camera is silently and discreetly recording video and audio to the concealed internal micro SD card.

Please note this is not a permanent security camera and should be used for limited surveillance purposes. When not being used for covert needs, it should be switched off.

Tell me how the WiFi Setup Works?

Setting up this Internet streaming WiFi camera is easy and takes just a few minutes and carried out directly from your iPhone or Android smartphone. Simply download the free streaming App to your iPhone or Android and then scan the QR code on the camera. Otherwise wait a few minutes for your phone to locate the WiFi device sitting on the wireless network, select the device, select your home or business WiFi network and you will be live viewing the camera. Once you see the camera live through our free App, the options from that point are huge.

To remotely view your camera from another location, you will need to enter your WiFi user name and password in order to access your router and the camera sitting on the network but this will only need to be done once your phone will them memorise.

Please note in some cases when sharing WiFi and Internet and could you have multi router passwords so in some cases (larger offices in particular) you may need to have an IT consultant assist you unless you happen to know the administrator user name and password. In this regard and in terms of tech support, we can only assist you so far. but normally support isn't needed and pretty much straight forward.

Connect the WiFi Docking Station hidden camera to a power point somewhere within wireless range your WiFi router. From your mobile phone, press settings and enable WiFi. Wait a few minutes for your router to see the new device online. After that time you should see a long series of numbers appear on your WiFi Network indicating that a new WiFi device has been found.

Download the free App from the App store. Once you see a series of numbers appear on your mobile phone, tick the numbers to connect and view the camera live. When you see the camera live on your cell phone this is where it gets really interesting. Users have the option to change the password, enter into motion detection recording mode or continuous recording mode, record at 1080P quality to an internal memory card, record to your mobile phone if preferred, listen into conversations surrounding the camera, receive email alerts if motion is detected, locally or remotely playback SD card indexed recordings and so much more.

Because the Docking Station Camera is AC powered (5V Power supply provided) it will stream live 24/7 but you must have WiFi enabled at the clock camera location. Some customers are concerned if others are sharing a local WiFi network in the home or office, those people will see the camera or suspect something is wrong. That's not the case. Remember you must have our App not to mention the correct user name and password so it's as safe a bank from that point if view.

Being user name and password protected there is no unauthorised use and apart from all of that, the only WiFi reference that any other person would see is a long series of letters and numbers which as mentioned mean nothing at all. There is absolutely no mention whatsoever to any a camera or any other device. To others the numbers could belong to neighbour's local WiFi so it's quickly disregarded and can't be accessed anyway.

Once you have the App installed on your phone and you have access to the camera live, it's at this point that you set the camera to follow your menu instructions. There is no setup on the Docking station as such it's all done from the free mobile phone App.

What happens when the SD card is full and how long will it last?

Remember you don't have to use a memory card at all. The authorised user/s may still view the camera live and be remotely alerted to motion but you may prefer to then record direct to your mobile phone rather than internal camera memory.

The highest recording level is 1920 x 1080 but that can be adjusted lower if preferred. At the highest recording quality and in real time, it will use about 6GB of memory per hour of recording. Consequently the larger the internal memory the more recording it can save before being filled. The Docking Station HD Spy Cam will accept up to 64GB of Class 10 micro SD card memory. Please note we use preferred SD cards brands and we do not take responsibility for non-compliant SD memory card so to order from Hidden Camera Surveillance.

Often we find a 32GB Class 10 SD card is sufficient but remember, you can set the camera to either STOP recording when the SD card is full or LOOP record which means when the memory is full, slowly start overwriting from the earliest recording date. This is also referred to as Recycle Recording.

If constantly recording to a 32GB micro SD card at 1080P quality, the SD card would be full in about 5-6 hours and for that reason we prefer to use the motion detection function. Menu select the MD recording duration and that could be anywhere from a few seconds to a few minutes at a time so you won't miss anything. If there is continual movement there will be continual recording anyway

Can I be alerted if motion is detected?

Yes of course. The free app will have the option to add an email address to receive alerts and with that alert a picture is attached. Once received you may login to the camera from your mobile phone from anywhere in the world, view the clock camera live and playback recordings from the internal memory card.

Check in on your babysitter, your pets, or keep an eye on your office any time you want, from anywhere in the world

**Specifications:**

Video Resolution 1920 x1080

Photo Resolution 4032 x 3024

Video format AVI

H.264 compressed format

P2P function

Chipset : Hi3518E V200

Lens : OV9712

5.0 megapixel FHD

Menu adjust colour, contrast & brightness

Frames 25 fps (real time)

Motion detection recording or Continuous recording

Motion event email alerts

Minimum illumination 1 LUX

Memory card max support 64GB (class 10 or better)

Recording: Approx.20 MB/min

Player software VLC Player, WM Player

Operation system Windows , MAC OS

Mobile phone operation system Android/iOS

Web browser IE7 and above, Chrome, Firefox, Safari.et
Built in microphone
Remote backup to PC
Wi-Fi remote control & view
No Monthly Fees - Never any monthly fees to view or record your video stream
Users up to 3 simultaneous viewers
Easy Installation - No complicated setup or network configuration needed
Smartphone Viewing - Free app for iPhone/Android phones & Password Protected
